## The Business Challenge

Enterprise software environments are getting more complex with an increase in the deployment of purpose-built applications to meet the needs of various functions and lines of business. That’s leading to an explosion of compatibility and integration challenges to make applications work together in common environments, sharing data and processes, and providing consistent user access to the applications.

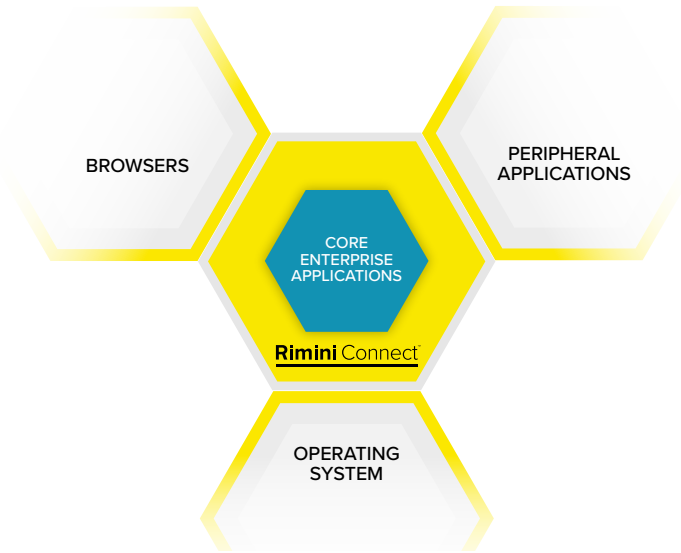

Technology environment components such as operating systems, browsers, and peripheral software applications change frequently, and not on the same timetables. When a change in a technology stack component causes an issue with an application, a software application vendor’s typical response is to make an application code change through a patch or an upgrade.

That approach to maintaining compatibility can be disruptive and incur significant costs in labor and time. The situation is even more complex when your landscape includes customized applications.

## The Rimini Street Solution

Rimini Street has successfully resolved thousands of compatibility issues on behalf of our clients since we started in 2005. From that experience, we developed [Rimini Connect](#) — a suite of interoperability solutions that help insulate applications from environmental changes using technology that acts as a “universal translator.”

Rimini Connect changes the game because it handles interoperability across the IT landscape outside of application code. It’s a revolutionary approach that liberates organizations from vendor-mandated upgrades and allows them to pursue a roadmap and innovations that matter to their business, at their own pace.

**KEY BENEFITS**

- Avoid cost, disruption, and risk of core enterprise software upgrades
- Extend the lifetime and value of existing, customized ERP systems
- Modernize IT by implementing the latest releases of browsers, operating systems, and other technology components
- Make applications work with any major browser, any version, regardless of the application’s specified compatibility requirements
- Upgrade to the latest operating system without upgrading your core enterprise applications

**“Anything could go wrong, so you’ve got to make sure everything works with each other. Now, your job, well, it’s about uptime and making sure you deliver on customer and employee experience. But you don’t have the resources, you don’t have the time, you don’t have the talent to be able to deliver on that. Imagine if there was a service that could actually give you that peace of mind. That’s what Rimini Connect is all about.”**

**Say “Yes” to the Business**

Digital transformation has fueled the development and adoption of best-fit software applications to drive improvements across organizations. Line of business leaders are demanding modern applications to achieve better outcomes in customer experiences, operations, supply chains, finance, human resources, analytics, and more. In turn, IT leaders are often expected to support a diverse portfolio of applications that don’t always share the same technology environment requirements.

Rimini Connect enables IT to be more agile and responsive to the business by making combinations of applications and other components work together that may not necessarily be certified as compatible by the various software vendors.

**Your Systems, Your Way with Rimini Connect**

Enterprise Resource Planning (ERP) systems typically represent a significant portion of IT investment for licensing and ongoing support and maintenance. They are the backbone of an organization’s software portfolio and are often highly customized to meet changing business requirements. Once these mission-critical systems are secure, compliant, stable, and performing, it’s a top priority to keep them that way.

While software vendors offer new releases and periodically reduce the support offerings for older releases, many organizations find the cost and risk of an upgrade outweigh the value of any new capabilities offered by the newer release. These organizations prefer to keep their current system running for many years, often 7-10 years or more.

During that lifespan, environmental components of the IT landscape change, including browsers, operating systems, and peripheral applications. Wanting the latest versions of those components for security, performance, and functionality reasons, IT leaders are challenged with making their existing ERP version compatible and integrated without applying patches or upgrading.

Rimini Connect helps future-proof interoperability by providing a revolutionary way for organizations to make their existing ERP work with other modern components of their IT infrastructure.

**Make Interoperability Issues a Thing of the Past**

The Rimini Connect suite offers easy-to-contract and easy-to-deploy solutions that provide always-on adaptability for your applications now and into the future.
