Rimini Connect™

Rimini Connect™ for Java

Did you know you can upgrade Java without changing the Java applications?

The Rimini Connect portfolio is designed to keep existing enterprise software running in a world of ever-changing technology. Rimini Connect for Java gives organizations the ability to upgrade Java versions without changing existing enterprise software applications.

Rimini Connect solutions have been proven over time. Rimini Street has successfully resolved thousands of compatibility issues on behalf of our clients since we were founded in 2005. Rimini Connect is built on those experiences and provides a suite of seamless interoperability solutions that eliminate compatibility surprises. Additionally, Rimini Connect interoperability solutions are fully supported by Rimini Street giving you peace of mind that our experienced team is there to support you.

Business Lifecycle Risks and Solutions

Many organizations depend on established enterprise software to run their essential business functions. These applications are typically reliable, have been in use for many years, and are only updated every five to ten years on average[1].

Updates to Java, on the other hand, are now happening approximately every six months[2]. These updates can include new features, security updates, and performance enhancements. A significant number of organizations are also moving to Open Source Java[3] which also releases updates every few months[4].

Traditional Compatibility Approaches are Reactive

Traditionally, enterprise software vendors release patches or create new software versions whenever there are changes to an operating system that impacts functionality. In today's environment, upgrading enterprise software has become expensive, requires substantial downtime for installation and testing, and can significantly disrupt business productivity.

Infrastructure teams may also turn to internally developed workarounds; however, each of these solutions come with drawbacks and may not enable the full functionality of Java updates including performance and security.

Rimini Street®

"

Clients are amazed at what's possible because they are usually only aware of options provided by vendors. Our solutions really help clients take control of their technology roadmap.

Desmond Whitt
VP & General Manager of Rimini Connect at Rimini Street
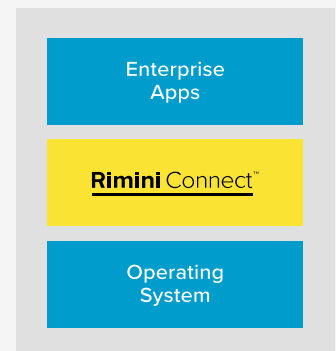

Run Existing Software With Your Choice of Java

Rimini Connect for Java builds an abstraction layer between existing enterprise applications and your preferred version of Java. This abstraction layer isolates the application, allowing it to function seamlessly with changes in the underlying operating system.

We use a variety of techniques to implement the abstraction layer, including intercepting and translating calls from enterprise software to the preferred version of Java, along with configuration updates to enhance compatibility and performance while leveraging new features.

Plan For Your Business Needs

Rimini Connect expands options for your technology roadmaps. Our interoperability specialists offer technology roadmap consultations to map upcoming changes in technology stacks and enterprise software. When combined with Rimini Connect interoperability solutions, organizations can choose to invest their resources upgrading the components that have the greatest impact on the business.

Make Interoperability Issues a Thing of the Past

The Rimini Connect platform helps clients avoid risk of business disruption with proven interoperability solutions bringing you peace of mind. We make it possible to decouple your existing enterprise software from your technology stack, proactively managing each roadmap independently. Our platform gives you the agility to extend the life of your enterprise software and gain a competitive advantage by avoiding rushed, unnecessary, and costly ERP upgrades. The Rimini Connect solution enables allocation of budget and resources for projects that truly benefit your business.
